

MLS Recruitment Analytics Pipeline

Nick Chabot
ISBA 4715

CHALLENGE

- MLS clubs evaluate thousands of players with limited analytical infrastructure
- Decisions blend structured stats, goals for, goals against, home wins, with unstructured context, including scouting reports, news, and analysis
- Front offices need both ends of decisions in the same place, automatically refreshed

PIPELINE ARCHITECTURE

- Two parallel paths feed into a unified analytical layer
- Both pipelines run on a schedule with secrets managed via GitHub Actions

ANALYTICAL DATA MODEL

- Match results joined to three dimensions
- This creates one row per finished match

Over 40% of Fixtures League-Wide ended in a Victory for the Home Team

Recommendation: Target signing players who have a higher match rating in home fixtures
→ Home Win % will increase 10% to over 50%

90% of Aston Villa's Losses Came on the Road

Recommendation:

Replace typical in-game starters with bench players performing better in road fixtures → see 4 less away losses and 4 more away draws, +4 points leads to 4th place finish in the league

9 Away Losses vs Only 1 At Home
+4 pts from draws → 4th place finish

Tottenham Sits 17th in the League with a GD of -1

66 points on +7 GD:
Significantly
overperforming

16 points lower
than clubs with 0
GD

Recommendation: Target defensive signings and transfers → Goal differential improves to +12 and points increase significantly to around 64
